FROM THE MARKETPLACE TO LIVE CLIENTS

Order it from your cloud. Have clients live in weeks.

Adverant Nexus installs from your cloud provider's marketplace into your own Kubernetes cluster. Add a domain pack, let the AI workforce map your data, and bring clients on as tenants or on clusters of their own, on any cloud.

Larkfield Labs. This Dublin studio builds and runs products for fintech companies, and appears in our film.

How it works

The same ten steps as the film

01
Find it
Nexus is in your cloud's marketplace, next to the business apps you already know.

02
Order it
One checkout. The licence goes on your normal cloud bill.

03
Install it
Into your own cluster, in the region you choose. It's up the same day.

04
Add a domain pack
A model of the business: entities, rules, workflows, screens, AI agents and access policies.

05
Let the AI build the ontology
Agents map a client's systems onto the pack. A person approves anything new.

06
Make it yours
Add fields, rules or screens, with or without code. Nexus versions and tests every change.

07
Add clients
As tenants on your cluster in minutes, or on a dedicated cluster in the region they want.

08
Keep it governed
Every agent has an owner and limits. People sign off the big decisions, and nobody can alter the records.

09
Go live and scale
Releases go out without downtime, and capacity grows to over a million users in weeks.

10
Move anywhere
Any cluster can move to another region, another cloud or a client's own data centre.

Adverant Limited · Registered in Ireland, company number 826944 · Venture Hub, 136 Capel Street, Dublin. Example companies and people are fictional.

Two ways to bring a client on

Both run from one Nexus

As a tenant. The client gets a private space on your cluster, with its own users, data and rules, in a few minutes.

On its own cluster. A bigger client gets a dedicated cluster in the region it wants, here Paris on a French cloud, from the same setup.

Inside a domain pack

The banking pack, for example

Entities

Customer, account, payment, card, merchant, KYC check, limit and dispute, and how they connect.

Rules and workflows

Hold large payments for review. Onboarding, disputes and limit changes, ready to run.

Screens, agents, policies

A screen for each role, AI agents for disputes and fraud triage, and who sees and signs what.

Banking · Insurance · Capital markets · Health · Energy · Logistics and ports · Life sciences · Legal · Government · Data centres · Defence

Built in from the start

For every tenant and cluster

Governance

- Each agent carries a passport that says what it's allowed to do
- Raising a limit takes two admins, and every model has a budget
- Anyone can check a sealed record without an account

Security

- Sign-in through the client's own identity provider
- Role-based access keeps each tenant's data apart
- Clients can hold their own encryption keys

Building and releasing

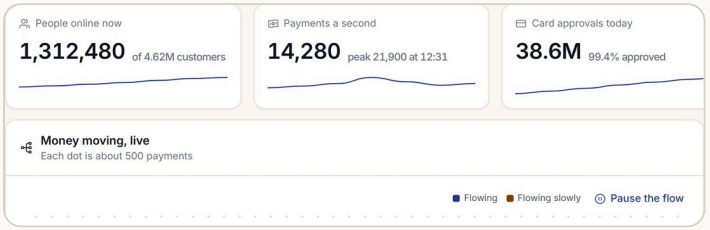

- Change things with or without code
- The Forge, GitHub or GitLab keeps every version
- A release that fails its tests doesn't go out

Scale and portability

- Capacity grows and shrinks with demand
- Upgrades without downtime
- Runs on any cloud with Kubernetes, or in a client's own data centre

In daily use

Lumière, a French neobank on its own cluster in Paris

Its back office runs on Nexus: payments, cards, disputes and KYC, with 1.3 million people online at peak.

Its 4.6 million customers bank in the Lumière app, built on the same parts.

For cloud providers

Nexus brings steady AI work onto your platform. Every tenant and cluster runs on your compute, GPUs and models. List it in your marketplace and bill it with your other services. Adverant never resells computing.

For software companies

Build once and serve many clients. Bring each one on as a tenant or on its own cluster, with the same packs, rules and release process for all of them.

See it with your own work

Pick one client and one job. We'll set it up on your cluster with you.
